

Greenhouse Growing Log

Turn a greenhouse from a place things happen into a place with a record, so a bad germination or a lost crop can be traced back to the week it went wrong.

A running log for a greenhouse, polytunnel or cold frame — the overnight low and the daytime high, what was watered and fed, how it was ventilated, what pests turned up and what was sown.

READ IT AT THE SAME TIME EACH DAY

A min/max thermometer is what makes this sheet worth keeping. Put it at plant height and out of direct sun, reset it at the same time each day, and the readings become a record you can compare rather than an impression.

Greenhouse / tunnel
